POPULATIOA OF MARYMAND 1930-1945

Fstimated us ci July l, for counties, urban and riral, by color (Urbari includes incomporated towns of 5,000 inhabitants or more in 1930)

hiaryland State Department of Fiealth
2411 North Charles Strect
Baitimore, Maryland

Possible methods for calculating the population in intercensal years include: 1) the natural increase, which takes into account the births, deaths, immigration and emierration occurring each year, and for which information with regard to migration within this state is not available; 2) the returns of school attendance which are not available; 3) the logistic curve of Pearl and Reed, which is more applicable to large population groups; 4) arithmetic progression, which assumes that the same numerical increase, which occurred between the last two census couits, will continue; and 5) geometric progression, which assumes that the same rate of increase which occurred during the last intercensal period will continue.

A comparison of the results of estimates, nade by the arithmetic and geometric methods, with the figures for the 1930 census, indicated that the method of arithmetic progression was more eenerally satisfactory for the population eroups withir the State of Maryland.

The method used was as follows:
Given the population of Maryland on January 1, 1920 and April 1, 1930, to find the population on July 1, 1931
$\frac{1,631,526-1,449,661}{123 \text { (months) }}=1478.5772$ (Nonthly increase)
$1,631,526+(1478.5772 \times 15$ mos. $)=1,653,705$ (Pop., July 1,1921)

Annexations: Four of the towns in Maryland annexed territory from adjoining areas between 1920 and 1930, necessitating special calculations up to and after the time of annexation. Only approximate figures were available for the number of indivicuals in each of the areas annexed, as follows:

3/28/34 - Maryland State Department of Health for State Plamine Commission

Estimation of population - 2

Population of annexed areas:

| Town | Date of annexation | Total | Population White | Colored |
| :---: | :---: | :---: | :---: | :---: |
| nd - Allegany Co. | December, 1929 | 5,000 | 4,900 | 100 |
| e - Dorchester Co. | Taken as April 1, 1930 | 400 | 300 | 100 |
| k Frederick Co. | July 1, 1924 | 600 | 583 | 12 |
| y Wicomico Co. | June 1, 1927 | 1,800 | 1,750 | 50 |

The population in each of these towns was calculated for 1930 as if there had been no annexation.

$$
\text { Let } \left.\begin{array}{rl}
y= & \text { Population in } 1930 \\
\text { if no annexation } \\
y_{1} & =\text { Census population } \\
\text { in 1920 }
\end{array}\right\}
$$

The equation states that the cersus population in 1930 is equal to the population in 1930, if no annexation had occurred, plus the population of the annexed area, plus the increase in the annexed area between the time of annexation and the census of 1930. Everything is known except "y" for which the equation is solved. A monthly increase can then be calculated for the annexed area and also for the town as if there nad been no annexation. Estimated porulations for the town for 1930-1945 were then based upon the sum of these two monthly increases.

Estimation of population of Frederick City for July l, 1931:

$$
\begin{aligned}
& 14434=y+600+69\left\{600\left[\frac{y-11,066}{123(11,066)}\right]\right\} \\
& y=13,752 \text { (Population of 1930, if no annexation) } \\
& \text { 14,434-13,752 = 682 (Population of annexed area in 1930) } \\
& \frac{682-600}{69}=1.188406 \text { (Monthly increase in annexed area) } \\
& \frac{13752-11066}{123}=2.183740 \text { (Monthly increase in original town) } \\
& 14434+(23.025804 \times 15)=14779 \text { Population of Frederick Juily } 1,1931
\end{aligned}
$$

Estimated as of July 1 , for counties, urban and rural, by color (Urban includes town of 5,000 imhabitants or more in 1930)
